

KCS Authoring Workflow Architecture

Policy-governed AI-assisted support knowledge workflow. Reviewer-only output. Python-owned decisions.

Caption: The workflow is Python-owned. Claude Desktop is used only as a bounded semantic review helper when deterministic item identification is low-confidence. Model output is validated as untrusted input before Python decides whether to create, update, flag existing, split, block, or produce no article. All outputs are reviewer-only; the workflow does not write to Zendesk, publish to Help Center, or auto-publish.
